This project uses Composer to manage CakePHP dependencies.

1. Download the Composer module into the project folder:

   https://getcomposer.org/download/

2. Install the CakePHP dependencies by running the following:

   `php composer.phar install`

   Accept the default for any prompts on configuring folder permissions.

3. In the `config` folder, copy `app.default.php` to `app.php` then edit the database settings to the appropriate user, password, database and host. (localhost if on same server.)

4. Make sure the MySQL database is already configured before attempting to register or login.

5. Enjoy!
